The FM6124 is a FRAM-based event-data-recorder solution that continuously monitors state changes, stores them in the FRAM memory, and alerts the system about the changes. Like a programmable-logic controller, the recorder features simple device settings and data retrieval for easy system integration and a shorter design-in cycle. The device is designed for broad industry use in the industrial-control, medical and metering markets. It can perform in equipment/environmental monitoring; maintenance scheduling; power-system management; automotive or industrial-automation event recording; vehicle- or pedestrian-traffic counting; and surveillance systems.
